Mark Jihru R. Diokno

Reflection

1. How project management principles were applied.

Project management principles were applied by uing RACI matrix, it made it easier in keeping our team organized. It also made It easier to give out and divide task per member. Like having two of our members do the introduction, while the others handle the methodology. At first, the app would be just a simple price checker, but after doing the interview, I realized that if we are just going to make a simple price checker app, we must also add features that make the app a bit more different than others like adding an AI that predicts if the price would go down or up.

2. UI/UX methods and strategies used.

The UI/UX methods and strategies used is the user-centered design approach. We used a color combination of White background, green accents, and cream. It also includes easy to read graphical charts. We also added explanatory labels like “Suggested Best Selling Period”.

3. Impact of Design Thinking on the solution.

Design thinking is important because we needed to solve the problem of information asymmetry and trust among farmers. Empathize and Define stages showed that farmers don’t just need raw prices, they needed the ability to predict and the context to avoid financial lost.

4. Recommendations for future improvements.

I think maybe an automated data integration. Using API’s from the PSA or Philippine Statistics authority or any logical agricultural bureaus to replace any manual data entry. Also an SMS capabilities, maybe try to develop an SMS based fallback feature to accommodate farmers in rural areas.
